Mentors: Andy Truscott & Izzy Coccuzza

The Fragmented Arts Scene: Problem & Solution

PROBLEM

Delaware is rich in artistic events, but it is difficult for Delaware residents and tourists to find out what is happening, which requires checking dozens of fragmented, outdated, or custom-built individual websites. DDOA wishes to solve this problem.

We built a master search engine that uses an AI agent that scrapes the internet for all of the events going on in Delaware, and then puts in one spot, the DDOA's website (Delaware Scene).

HOW OUR AI AGENT OPERATES: DDOA'S SYSTEM FLOW

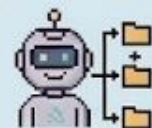

3

We wrote a web search tool that runs site-restricted queries across our curated list of 76+ Delaware arts, venue, library, and government websites. It searches sites in parallel, retries rate-limited queries with backoff, and filters out outdated results.

Page-fetcher downloads each result and readable text is extracted with **BeautifulSoup**, and stores both the raw HTML and **clean text** in a searchable SQLite database.

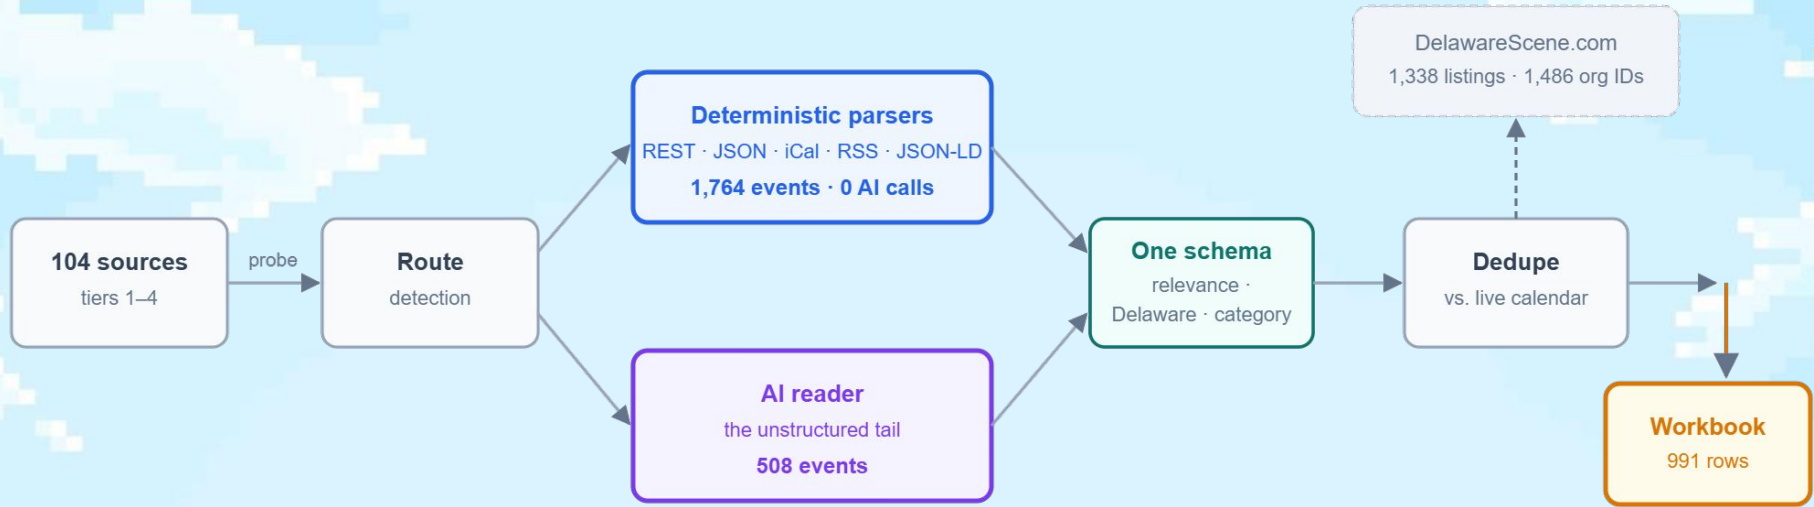

We wrote agent code that feeds the collected page text into an LLM with a strict JSON output schema, producing structured event records that include **details** such as title, presenting organization, venue/address/city, dates/times (including ranges), type of event, source ticket URL, and phone number.

The structured events are stored and served through upcoming **Delaware events** across all three regions, **tagged** by source tier (ddoa-grantee / non-grantee).

DEMO

IMPACT FOR DELAWARE:

5

- Delaware Residents and Tourists can easily discover free and affordable cultural events happening in their local neighborhoods without visiting dozens of websites.

- Smaller nonprofits and local events with low marketing budgets gain equal visibility alongside more popular events.

- DDOA would have an automated statewide event cataloging without spending hundreds of staff hours manually copying event details

- Overall, ~20+ hours per week of manual data entry for state event aggregators and saves thousands of dollars in annual services

- The entire pipeline can be deployed on a platform as small service, feeding directly into the Delaware Scene

The structured events are stored and served through upcoming **Delaware events** across all three regions, **tagged** by source tier (ddoa-grantee / non-grantee).

RESPONSIBLE AI & DATA:

6

- The data used includes publicly accessible event pages, organizational websites, and public Google Search indexes. No private, gated, or personal identifying data is scraped.

- All scraping done by the AI agent is strictly read-only, following standard web protocols.

- One limitation of the AI agent is that it's still possible for it to hallucinate or mix-up event information and details.

COMPUTE PLATFORM & LEARNING:

- **COMPUTE PLATFORM & LEARNING:** We primarily used AWS and GCP

- **FROM PROTOTYPE & PRODUCTION:** What works today, current limitations, what would need to change for production, and concrete next steps for an agency pilot.

- Register a Domain (instead of <http://www.udel.edu/0014913>)

TAKEAWAY:

- Discovering events in your area is cumbersome when they are scattered across dozens of disconnected websites.
- An AI-powered search engine that scrapes these websites provides the solution.
- DDOA would be able to successfully extract all upcoming events, and put them all into one spot on their website, the Delaware Scene.
- This ensures no Delaware resident or tourist misses out on local arts and community experiences, strengthening Delaware's culture, and bringing us all together.
