

DCSS OWLS

(Organized Wisdom & Learning Support)

By: Arun Vittedi, Sylv Chen, Gopi Melam, Nathan Graddon

Mentors: Ashley Dibert, Heather Morton, Tasha Alessia

Problem and Solution

Problem

- Currently manual searching
 - Policies and procedures
 - Official documents
 - Federal State/partner websites
- Time consuming
- Clarify revisions or conflicts

Our Goal

- Non public facing assistant chatbot
- Summarizing policies and providing sources
- Including verified/effective/revised dates
- Compare differences in revised policies
- Direct to supervisors if the question is out of scope
- Can be scoped out

Workflow

Boxes marked with  represent platform dependencies (AWS, GCP, & Microsoft).

Our Process

1

Mentors provided Data: policies, docs, sites, etc.

2

We built our chatbot workflow (logic/foundation) using **KIRO**.

-Claude Opus 5 (Max)
-Spec

3

Push work to Github repository.

4

Branch & use individual platforms to build the Chatbot.
(Foundation + Platform specific: Knowledge Base & LLM)

GCP

- **LLM:** Gemini
- **KB:** GCP Buckets
- **Embeddings:** GCP Vector

Microsoft

- **LLM:** GPT 5.4 MINI
- **Stored Data:** Azure Blob container
- **Embeddings:** Azure AI search

AWS

- **LLM:** Nova 2 Lite via Bedrock
- **KB:** (bedrock)S3 Vectors
- **Embeddings:** Titan

Solution

Responsible AI and Platforms used

- Directing to supervisors if there are no found answers in policies
- Warnings not to share private information included
- Checks for conflicts in policies
- Includes sources for checking
- No private or sensitive information in stored documents

AWS

- KIRO used to set up our foundation and workflow

GCP

- Built on Google's historical data expertise so plethora of integrated features

Microsoft

- Connection between foundry and azure cloud storage is convenient with one project

Next Steps

1. Searching through included websites
2. Agent allows and prompts for follow up question
3. Survey and Question Id's
4. Fine tune the model to give each user a personalized experience

Implementation into DCSS systems and expanding the product to other divisions or organizations

Takeaways

- Using AI for record keeping and easier retrieval of documents
- Experimenting with different cloud service providers and using RAG for querying, document searching, and citations
- Making the project scalable for continued use in DCSS
- **Acts as a single unbiased source of truth**
